## الخلاصة

يتضمن البحث تحضير مجموعة من المعقدات الجديدة ذات الصيغة العامة  $[M(L)_2]$   $Cl_2$  و  $L_1, L_2, L_3=L$  [M(L)<sub>2</sub>]، إذ أن M تمثل ايونات Co(II), Ni(II), Cu(II), Zn(II), Cd(II) وان L<sub>1</sub> تمثل (Z)-3-(4-ميثوكسي فينيل ايمينو) اندولين-2-ون وان L<sub>2</sub> تمثل (Z)-1-((4-ميثوكسي فينيل ايمينو) ميثيل) نفثالين-2-اول وان L<sub>3</sub> تمثل (Z)-2-(4-ميثوكسي فينيل ايمينو) -2- فينيل ايثانول. تكونت المعقدات بنسبة 2:1 (فلز: ليكاند). تم دراسة وتشخيص هذه المعقدات المحضرة باستخدام التحليل الدقيق للعناصر وقياس الحساسية المغناطيسية والتوصيلية المولارية الكهربائية وطيف الأشعة تحت الحمراء والأطياف الالكترونية. أظهرت قياسات الأشعة تحت الحمراء ارتباط الليكاند من خلال ذرة النيتروجين لمجموعة الازوميثاين وذرة الأوكسجين لمجموعة الكاربونيل لليكاند الاول أو ذرة الأوكسجين لمجموعة الهيدروكسي بالنسبة لليكاند الثاني والثالث لجميع المعقدات وأظهرت قياسات المغناطيسية والأطياف الالكترونية بنية رباعي السطوح لجميع المعقدات ودلت قياسات التوصيلية الكهربائية لهذه المعقدات بأنها ذات طبيعة كترولييتية بنسبة 2:1 لليكاند الأول وذات طبيعة متعادلة غير الكترولييتية لليكاندين الثاني والثالث.

أظهرت اختبارات الفعالية البايولوجية لمعظم المعقدات المحضرة قدرتها العالية لتثبيط نمو نوعين من البكتريا *Staphylococcus aureus* و *Escherichia coli*.

## Abstract

Metal complexes of general formula  $[M(L)_2]Cl_2$  and  $[M(L)_2]$ ,  $L=L_1, L_2, L_3$  have been prepared where M is Co(II), Ni(II), Cu(II), Zn(II)

and Cd(II),  $L_1$  is (Z)-3-(4-methoxyphenylimino) indolin-2-one,  $L_2$  is (Z)-1-((4-methoxyphenylimino) methyl) naphthalene-2-ol,  $L_3$  is (Z)-2-(4-methoxyphenylimino)-2-phenylethanol. The complexes which have the molar ratio of 1:2 (metal to ligand). The complexes were characterized by elemental analyses, magnetic and conductance measurements infrared absorption spectra and electronic spectra. IR spectra showed that the nitrogen of the azomethine group, carbonyl oxygen of  $L_1$  or the oxygen hydroxy group for the  $L_2$  and  $L_3$  take part in coordination. Magnetic susceptibility measurements and electronic spectra studies suggested a tetrahedral structure for all complexes. Conductance measurements indicating the 1:2 electrolytic nature for  $L_1$  and non electrolyte for  $L_2$  and  $L_3$ . The biological activity testes indicate that most of the prepared complexes posses high ability to inhibit growth *Staphylococcus aureus* and *Escherichia coli* bacteria.

### **Introduction**

Schiff base and their metal complexes have important and popular area of research due to their liquid crystal complex formation tendencies<sup>(1)</sup>, simple synthesis, diverse range of application<sup>(2-4)</sup> and played a central role in the development of coordination chemistry<sup>(5,6)</sup>. The presence of azomethine group in these molecules made them acting as suitable ligands towards metal ions and forming different coordination compounds<sup>(7,8)</sup>.

The complexes make these compound effective and stereospecific catalysts for oxidation, electroreduction, decomposition, hydrolysis, reaction on oxygenation. It is well known that some drug have higher activity when administered as metal complexes than as free ligands<sup>(9-11)</sup>. p-anisidine as apart in ligand which is aniline derivative have been found to be biologically interesting compound for many years and show antibacterial activity<sup>(12,13)</sup>. Also, compounds containing isatin, naphthyl groups derived Schiff bases has been studies and has attacked great attention for long time showed that possess anti HIV activity, antibacterial, enhance fungicidal activity<sup>(14-16)</sup>. In this work we described and prepared Schiff base from anisidine and isatin, 2-hdroxy-1-naphthaldehyde and o-hydroxyacetophenone and its mononuclear complexes with Co(II), Ni(II), Cu(II), Zn(II) and Cd(II) ions.

### **Experimental**

#### **A-Preparation of Schiff bases:**

An ethanolic solution (20 ml) of isatin (0.01 mole, 1.47 g) or 2-hydroxy-1-naphthaldehyde (0.01 mole, 1.72 g) or o-hydroxy acetophenone (0.01 mole, 1.36 g) were added to an ethanolic solution (10 ml) of p-anisidine (0.01 mole, 1.23 g) and this mixture was refluxed for 2 hr. The reaction mixture was then cooled in an ice bath which

immediately gave a precipitated product then was separated by filtration, washed with the cold ethanol and ether and then air dried.

### **B-Preparation of the Complexes:**

A hot ethanolic solution (20 ml) of metal(II) chloride (0.01 mole) was added to an ethanolic solution (10 ml) of Schiff base (0.02 mole) and this mixture was refluxed for 3 hr. The reaction mixture was concentrated to half its volume by evaporation. On cooling the complexes which precipitated, filtered off, washed with ethanol and ether and then air dried.

### **Analysis and Physical measurements:**

Elemental analysis was carried out on a Costech instruments (Element combustion system, International Sp.A., Model 4010, Italia). The metal content were determined according to the standard procedure<sup>(17)</sup>. Analysis of ligands and complexes were carried out using standard method of analysis. The metal contents were estimated spectrometrically using (SP6-350 atomic absorption spectrophotometer, Pye – Unicam, England). Molar conductivities of the complexes have been measured in an electrolytic conductivity measuring PCM3 (Jenway) conductivity using  $10^{-3}$  M of the complexes in N,N-dimethylformamide (DMF) solution at room temperature. Infrared spectra in the range 400-4000  $\text{cm}^{-1}$  were recorded on a Perkin-Elmer 580 B spectrophotometer, as KBr disc. Electronic spectra were obtained with Shimadzu UV/Vis, recording UV160 spectrophotometer in DMF at room temperature for  $10^{-3}$  M solution of the compounds using a 1 cm quartz cell. The magnetic measurements were carried out at 25°C on the solid by a Faraday's method using Bruker BM6 apparatus and melting points were determined by using Electrothermal 9300 Engineering LTD apparatus.

### **Biological activity**

Preliminary biological activity screening of the synthesized compounds has been performed at 100  $\mu\text{g}$  /ml DMF against microorganisms representing Gram-positive bacteria (*Staphylococcus aureus*) and Gram-negative bacteria (*Escherichia coli*), using nutrient agar medium. By pouring the sterile agar into Petri dishes in aseptic conditions, 0.1ml of each standardized test organism culture was spread onto agar plates<sup>(18)</sup>. The sensitivity of a microorganism to antimicrobial agents was determined by the assay plates, which were incubated at 37 °C for 1 day.

### **Results and discussion**

The metal complexes of the Schiff bases were prepared by reacting the metal (II) chloride and the Schiff base in the molar ratio M:L = 1:2.

All the complexes are stable solids and colored at room temperature. The values of molar conductivities for these complexes in DMF expected for 1:2 electrolytes (Table 1) indicating the ionic nature<sup>(19)</sup> and consistent with given formula  $[M(L)_2] X_2$ ,  $L=L_1$  for the complexes (1-5) while complexes of the type  $[M(L)_2]$ ,  $L=L_2, L_3$  are nonelectrolyte (Table 1).

### IR Spectra

The IR spectra of the Schiff bases showed characteristic absorption bands at the ranges (3271-3298, 1641-1643, 1739 and 3230  $\text{cm}^{-1}$ ) due to  $\nu(\text{O-H})$ ,  $\nu(\text{C=N})$ ,  $\nu(\text{C=O})$  and  $\nu(\text{NH})$  stretching vibrations respectively (Table 2).

The azomethine bands at 1739 and (1641-1643  $\text{cm}^{-1}$ ) due to  $\nu(\text{C=O})$  and  $\nu(\text{C=N})$  stretching frequencies respectively in the free ligands shift towards lower values in all complexes (1690-1712  $\text{cm}^{-1}$ ) and (1610-1628  $\text{cm}^{-1}$ ) indicating that the carbonyl oxygen atom of the isatin residue and the azomethine nitrogen atom are coordinated for  $L_1$ <sup>(20-22)</sup>. However, the band at 3230  $\text{cm}^{-1}$  due to  $\nu(\text{NH})$  of isatin remained unchanged indicating that it is not involved in the coordination<sup>(23)</sup>. On the other hand the (C-O phenolic) band of the  $L_2, L_3$  at (1248-1252  $\text{cm}^{-1}$ ) in the free ligand was moved to a higher frequency (1281-1304  $\text{cm}^{-1}$ ) after complexation which means that the shifts are due to coordination of ligand to metal atom by phenolic oxygen<sup>(24)</sup>. Moreover, the new bands appearing in the spectra of the metal complexes and not observed in the spectra of the free Schiff bases with in 459-472  $\text{cm}^{-1}$  and 416-426  $\text{cm}^{-1}$ <sup>(25,26)</sup> assigned to M-O and M-N modes conclusively indicated that the ligands are coordinated to the metal ions through these groups.

### Electronic Spectra and magnetic moments

For tetrahedral cobalt(II) complexes, three bands can be observed these are assigned to the transitions:  ${}^4A_2(F) \rightarrow {}^4T_2(F) \nu_1$  3000-4000  $\text{cm}^{-1}$

$${}^4A_2(F) \rightarrow {}^4T_1(F) \nu_2 \quad 6000-8000 \text{ cm}^{-1}$$

$${}^4A_2(F) \rightarrow {}^4T_1(P) \nu_3 \quad 13250-16600 \text{ cm}^{-1}$$

The electronic spectra bands for Co(II) complexes are given between (14836-16447  $\text{cm}^{-1}$ ), assigned to the transition electron.

${}^4A_2(F) \rightarrow {}^4T_1(P) (\nu_3)$ . The other two bands  $\nu_1$  and  $\nu_2$  (due to  ${}^4A_2(F) \rightarrow {}^4T_2(F)$  and  ${}^4A_2(F) \rightarrow {}^4T_1(F)$  transition) were absence because they fall below the limit of our instrument<sup>(25)</sup> and bands at (30303-32894  $\text{cm}^{-1}$ ) assigned to the charge transferee which also supported a tetrahedral arrangement around Co(II) ion<sup>(27,28)</sup> (Table 3).

The magnetic moments obtained for Co(II) complexes (3.97-4.40 B.M) suggesting a tetrahedral geometry.

For tetrahedral nickel(II) complexes, three spin allowed transitions are expected these are:

and  $\nu_1$  and  $\nu_2$  usually located below the instrumental limit.

The electronic spectra of Ni(II) complexes showed strong band between (14450-14880  $\text{cm}^{-1}$ ) region assignable to the transitions  ${}^3T_1(F) \longrightarrow {}^3T_1(P) \nu_3$  which are assigned as d-d transition for  $\text{Ni(L)}_2$  Transition of tetrahedral geometry<sup>(29,30)</sup> and bands at (31055-33334  $\text{cm}^{-1}$ ) assigned to the charge transfer the position of the band indicated that these complexes exhibited tetrahedral geometry.

The Ni(II) complexes gives magnetic moments between (3.25-3.65 B.M.) supporting tetrahedral geometry (Table 3).

Three bands were observed at (31055-33334  $\text{cm}^{-1}$ ) assigned to the charge transfer. The position of the bands indicated these complexes exhibited tetrahedral geometry.

The copper (II) complex display broad band at (9803-14925  $\text{cm}^{-1}$ ) Corresponding to  ${}^2T_1 \longrightarrow {}^2E$  transition, and band at (29239-32679  $\text{cm}^{-1}$ ) which might be assigned to the charge transfer transition supporting tetrahedral geometry of the Cu(II) complexes<sup>(31)</sup>. The magnetic moment of the Cu(II) complexes has been found between (1.91-2.09 B.M.), this corresponds to the presence of one unpaired electron in the complexes.

For the Zn(II) and Cd(II) ions have no unpaired electrons and given an intense band situated at (28409-32894  $\text{cm}^{-1}$ ) which can be assigned to the charge transfer transition<sup>(32)</sup> from M to L and  $\pi$  to  $\pi^*$  transitions, on complex formation this bands may be shifted to lower wave length from ligands spectra. These observations represented a further indication about the coordination of the ligands with the metal ions<sup>(33,34)</sup>. Therefore Zn(II) and Cd(II) complexes are expected diamagnetic whether they have tetrahedral structures<sup>(35)</sup>.

From this study, it can be concluded that the ligands acted as bidentate chelating ligand coordinated to the metal ions through azomethine nitrogen atom, carbonyl oxygen atom of the isatin residue for  $L_1$  and hydroxyl-1-naphthaldehyde oxygen for  $L_2$  and hydroxy acetophenone oxygen for  $L_3$  and azomethine nitrogen atoms. As a result tetrahedral structure was suggested for all the complexes as shown in Figure (1,2 and 3).

### Biological activity

As shown in the Table (4) of the compounds (1, 2, 4 and 15) have the higher inhibition effect on bacterial cultures gram-positive bacteria (*Staphylococcus aureus*) (12, 13, 14 and 12 mm) (Figure 4). While, compounds (13 and 15) have the higher inhibition effect on bacterial cultures gram-negative bacteria (*Escherichia coli*) (14 mm and 13 mm)(Figure 5).
